

IT Service Request Management Portal

Project Documentation

Prepared for B.Tech Project Submission

Abstract

The IT Service Request Management Portal is a custom ServiceNow application developed to streamline IT service request handling. Employees can submit requests, technicians process assigned requests, managers oversee operations, and administrators manage the platform. The application includes workflows, business rules, client scripts, UI policies, notifications, reports, dashboards, and access control lists.

Introduction

Organizations require a centralized platform to manage IT requests efficiently. This project demonstrates how ServiceNow can automate request submission, assignment, approval, notification, reporting, and monitoring.

Problem Statement

Manual IT request handling is slow, difficult to track, and prone to errors. A digital workflow improves efficiency and transparency.

Objectives

- Automate IT request management.
- Notify users automatically.
- Generate reports and dashboards.
- Secure records using ACLs.

Technologies Used

ServiceNow Studio, Flow Designer, Business Rules, Client Scripts, UI Policies, Notifications, Reports, Dashboards, ACLs.

Modules

Service Request, IT Services, Reports, Dashboard, Notifications, Security Roles.

Database Design

Custom tables include Service Request, IT Services, and Approval. Fields include Request Number, Employee, Department, Request Type, Priority, Status, Assigned To, Description, Requested Date, and Due Date.

Flow Designer

A flow triggers when a Service Request is created and updates records, sends notifications, and automates request processing.

Business Rules

Business Rules enforce server-side logic and maintain data consistency.

Client Scripts

Client Scripts validate user input and improve user experience on forms.

UI Policies

UI Policies dynamically control field visibility and mandatory behavior.

Notifications

Email notifications include Request Submitted, Approved, Assigned, and Rejected.

Reports

Reports created: Requests by Status, Requests by Priority, Requests by Department, Monthly Requests, Technician Workload.

Dashboard

The IT Service Dashboard displays request summaries, charts, and workload metrics.

Security (ACLs)

ACLs provide role-based access for Employee, Technician, Manager, and Admin users.

Testing

The application was tested by creating service requests, updating statuses, validating notifications, verifying reports, dashboards, and role-based access.

Advantages

Automation, transparency, faster response, improved tracking, centralized reporting, and enhanced security.

Future Enhancements

Integration with CMDB, SLA management, Knowledge Base, Virtual Agent, and mobile support.

Conclusion

The project successfully demonstrates an end-to-end IT Service Request Management solution using ServiceNow best practices.
